Homework 6 – Flower Search

CS 6515: Introduction to Graduate Algorithms

**NP Proof:**

- Verify the solution,  $S$ , to the *Flower-Search* problem by first inducing the subgraph of  $S$ . This takes  $O(n + m)$  time.
- Validate that  $N$  vertices make up a clique by finding all vertices with a degree  $\geq N-1$  and are connected to one another by an edge. This takes  $O(n^2)$  time.
- Validate that the remaining vertices make up a star by verifying that three vertices have a degree of one and are connected to a common central vertex. This takes  $O(n + m)$  time.
- Verify that there is a path from the central vertex in the star to a vertex in the clique. This takes  $O(n + m)$  time.
- Finally, verify  $|S| = N + 4$  in  $O(n)$  time.
- Overall runtime is  $O(n^2)$ , which is polynomial time.

**NP Complete Proof:**

**Reduction:** Clique  $\rightarrow$  Flower-Search (F.S.)

**I.T.:**

- Given  $G=(V, E)$  and  $N$ .
- A star consists of four vertices, featuring a central vertex,  $v'$ , which connects to three other vertices that do not share an edge with each other.
- Create  $G'$  by adding a star to every vertex in  $G$ .
  - o Each star will be added by an edge from  $v'$ .
  - o This takes  $O(n^2)$  time.
- Pass  $G'$  and  $N$  into F.S. in  $O(1)$  time.
- Overall transformation time is  $O(n^2)$ , which is polynomial.

**O.T.:**

- Return NO, if F.S. returns NO in  $O(1)$  time.

- Return solution of F.S., removing the four vertices that make up the star, leaving a clique.
  - o To find the star, find the three vertices with a degree of one that are connected to a common vertex (the fourth vertex). These four vertices will be removed.
  - o This takes  $O(n + m)$  time.
- Overall transformation time is  $O(n + m)$ , which is polynomial.

### Correctness:

- If Clique returns a solution,  $S$ , we have a solution for F.S. by adding a star, from its central vertex, to each vertex in  $S$ , resulting in  $N + 4$  vertices that form a flower.
- If F.S. returns a solution,  $S$ , we have a solution for Clique by removing the star from  $S$ , resulting in an  $N$ -sized clique.
- F.S. has a solution IFF there is a star added, from its central vertex, to the Clique solution.
